

MailDefender Email Archive

MailDefender Email Archive from intY provides a reliable offsite, and secure storage facility for all your emails. Hosted by Software-as-a-Service experts, it provides compliance with regulatory requirements and ensures emails can always be accessed when required.

The service can be configured in minutes and is managed by an intuitive web portal, with self service end user accounts for rapid access.

With a fixed monthly cost per user, no upfront charges and no charge for storage*, MailDefender Archive is the affordable way to take control of email policy once and for all.

- Software-as-a-Service
- LOW cost
- Immediate setup
- Full compliance

Optional legacy Email Import

Upload old company emails to your Archive to create a completely secure, searchable repository for your company's entire email history.

Why Archive?

The need to securely archive and rapidly produce email is no longer just a requirement of the Financial Services industry. Increasingly it is becoming a mandatory regulatory requirement for organisations of all sizes.

Studies have shown that for typical organisations today, a huge proportion of their critical business data resides in emails with steadily rising management costs. In the event of a problem, the implications of this data being held in an insecure location, without adequate search and retention policies don't need spelling out.

Increasingly email and storage administrators have to answer key questions such as:

- Where is specific business data held?
- What actions were taken to preserve it?
- How can the data be searched and reproduced?
- What is the company's data retention/deletion policy?

Effortless Protection

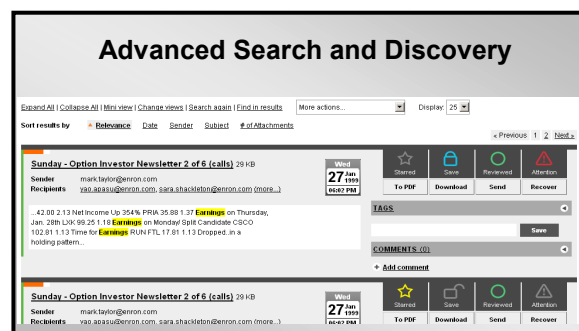

MailDefender Email Archive is a superior email archiving and discovery solution delivered as a Software-as-a-Service (SaaS) solution. It has no charge for the storage used*, enabling cost effective storage management of critical company data.

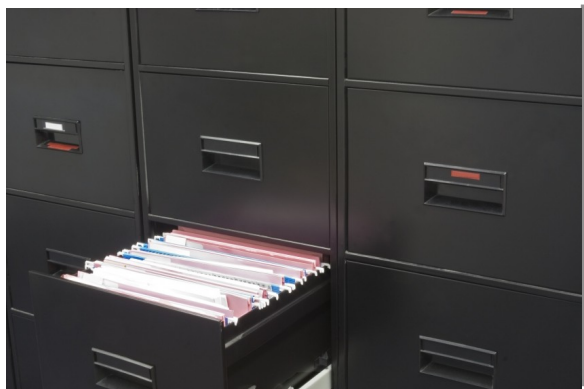

It is simple to deploy, requiring no hardware or software, just a minor configuration change to journal mail traffic to the Archive service. Legacy emails are straightforwardly imported, to provide a comprehensive repository of all company email.

Based on ultra-reliable grid utility storage and highly scalable virtual computing resources operated to SAS 70 standards, the MailDefender Archive infrastructure is fully resilient for complete data integrity.

All mails are analysed and tagged upon storage, and the management portal enables powerful searches to be rapidly built to query for message text, attachments, and a wide range of metadata. Search results are produced instantly and can be exported to .PST, .PDF, .txt, MIME, and more.

* Subject to Acceptable Use Policy

Service Features

Backup and storage:

- Delete emails from inbox– unlimited backup
- Automatic storage of all inbound and outbound messages
- Backup every email– don't rely on users to keep their own email backups on laptops
- Protect crucial business information
- Secure, on-demand storage
